

SUMMARY FOR PUBLICATION

Orica Yarwun Nitrates facility is applying for a 2 year Multi Year Monitoring Period covering FY24 and FY25.

The installation of two tertiary abatement reactors at Orica's Yarwun manufacturing facility will eliminate the equivalent of approximately 50 per cent of the facility's total greenhouse gas emissions. This equates to at least 200,000 tonnes of carbon dioxide equivalent (CO₂-e) annually once the project is complete.

The projects have come online in late FY24 and early FY25. The installation of the first reactor at Yarwun was achieved safely, on time and on budget in March 2024, with the second reactor operational by the end of September 2024. It follows the successful implementation of similar tertiary emissions abatement technology at Orica's Kooragang Island facility in New South Wales, Australia.

The net emissions for the multi-year monitoring period are expected to be 503,000 tCO₂-e.
